

Executive Summary Dashboard

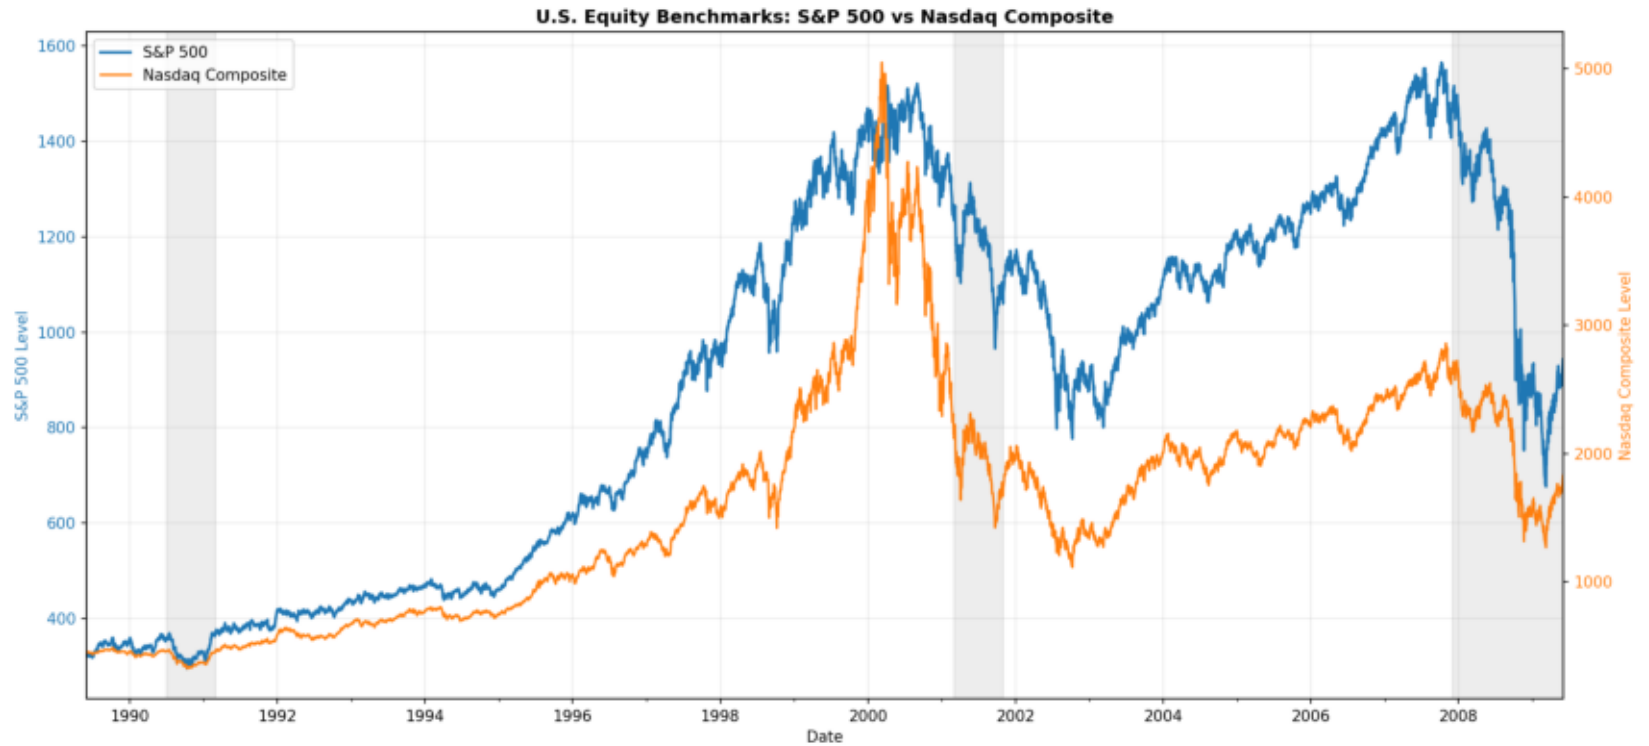

Status Snapshot (1989-06-01 to 2009-06-01)

Elevated Risk Watch Zone Normal Favorable

Tracker Comparison (1989-06-01 to 2009-06-01)

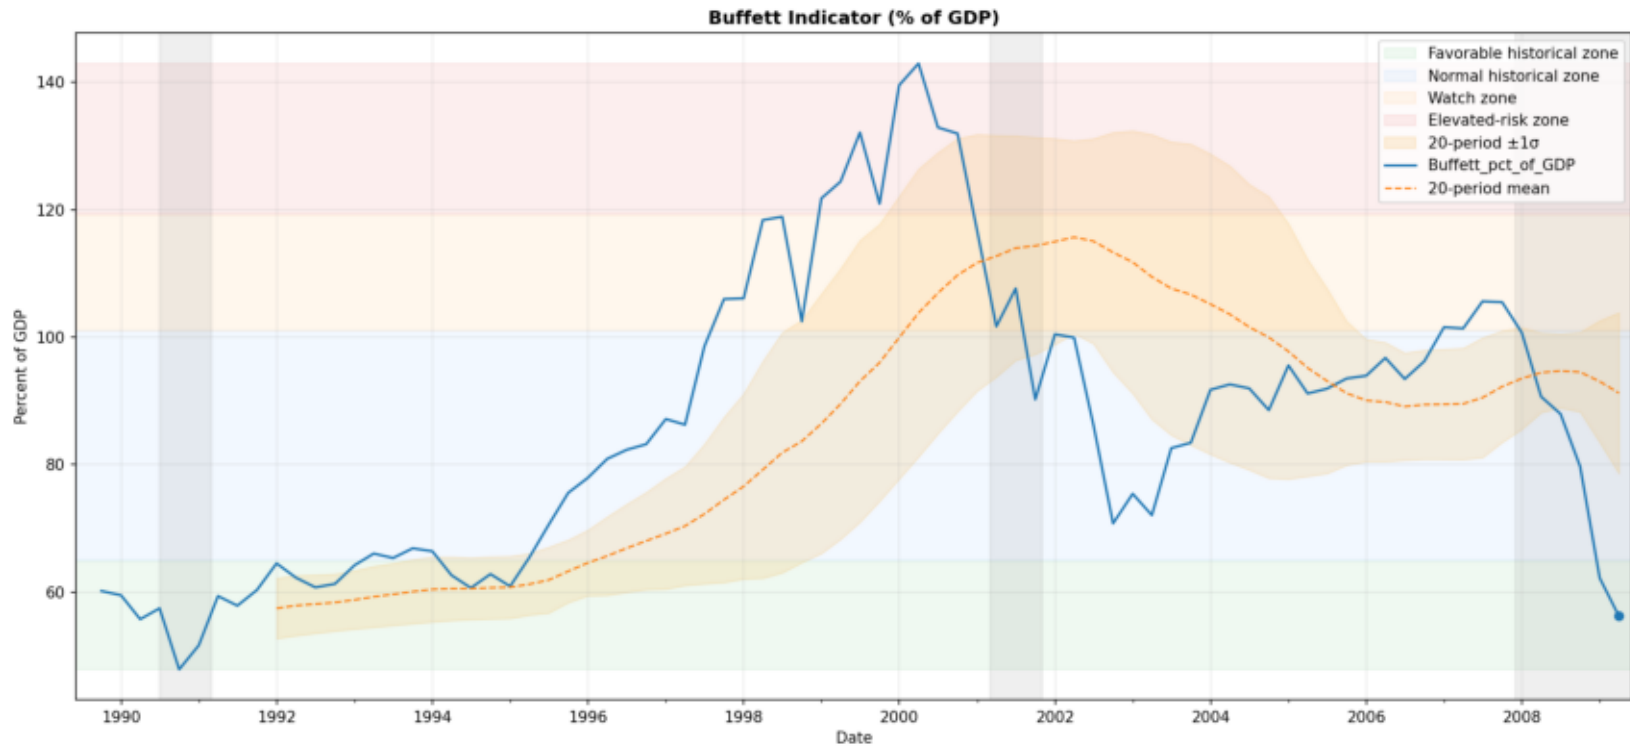

market_indices_tracker.py [BOTH]

Market indices tracker plots S&P 500 and Nasdaq Composite on separate y-axes to show broad equity trend and growth/tech sensitivity side-by-side. Recession bands are overlaid for cycle context, while status is derived from the pair's composite drawdown versus prior peaks.

Tracker Comparison (1989-06-01 to 2009-06-01)

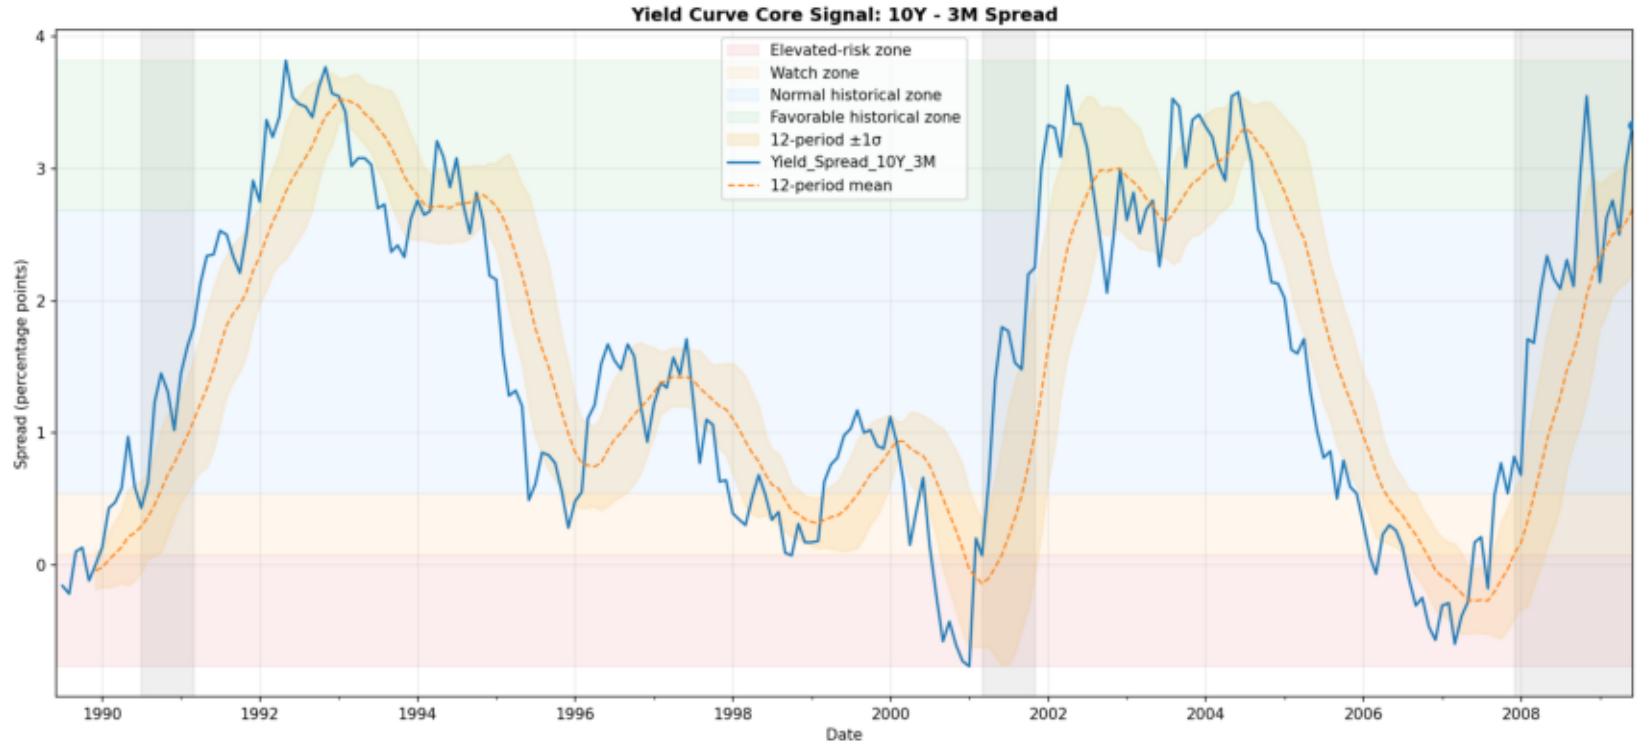

buffet_tracker.py [BOTH]

Buffett Indicator tracks total U.S. equity market value relative to U.S. GDP. Higher values indicate richer aggregate equity valuation versus the size of the economy, which is typically interpreted as higher long-term valuation risk rather than a short-term timing signal.

Tracker Comparison (1989-06-01 to 2009-06-01)

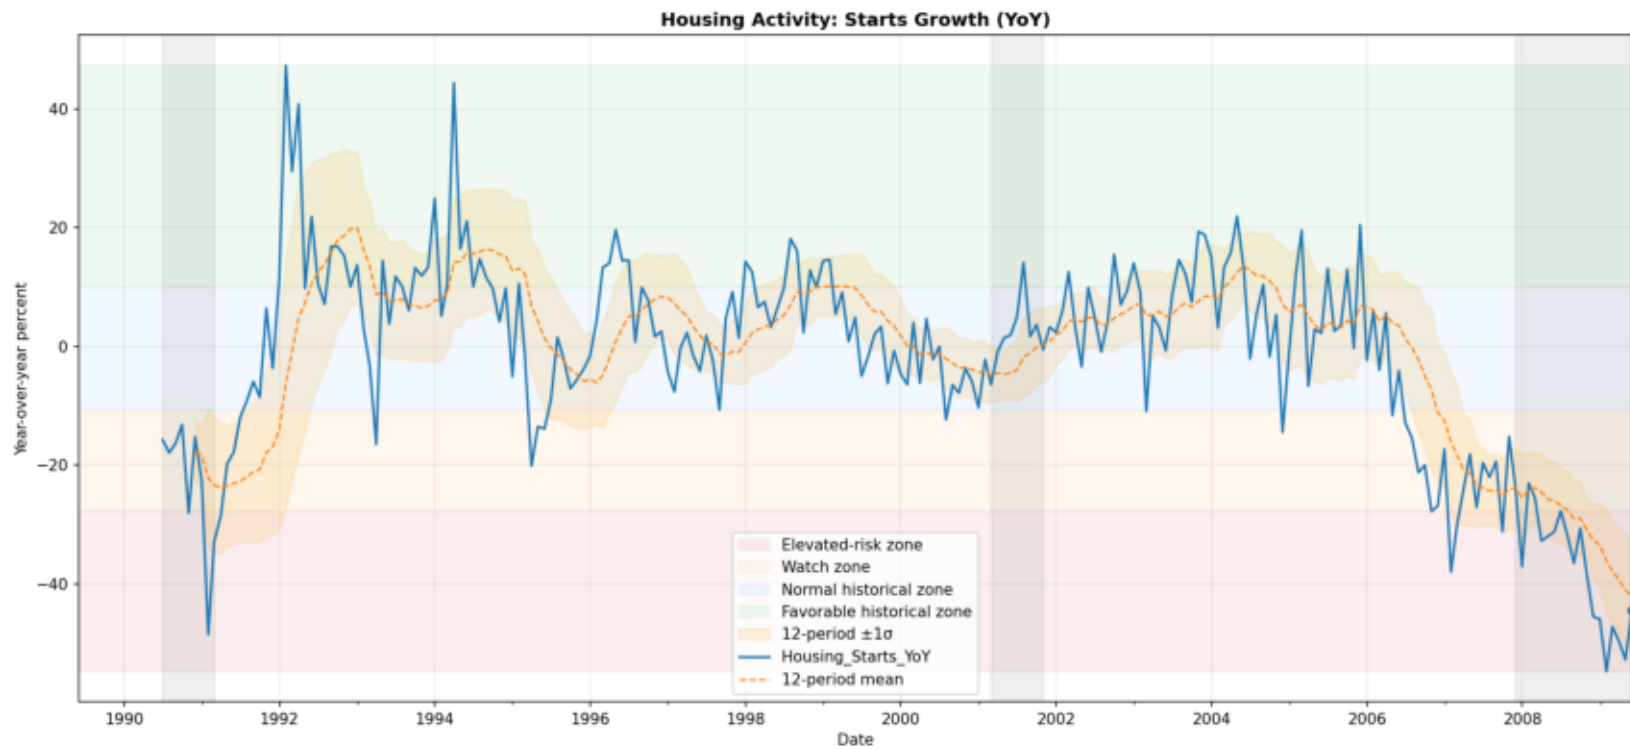

yield_curve_tracker.py [BOTH]

Yield Curve core signal uses the 10Y-3M Treasury spread. When the spread compresses toward zero or turns negative (inversion), recession risk is generally interpreted as rising; positive, wider spreads usually indicate less immediate cyclical stress.

Tracker Comparison (1989-06-01 to 2009-06-01)

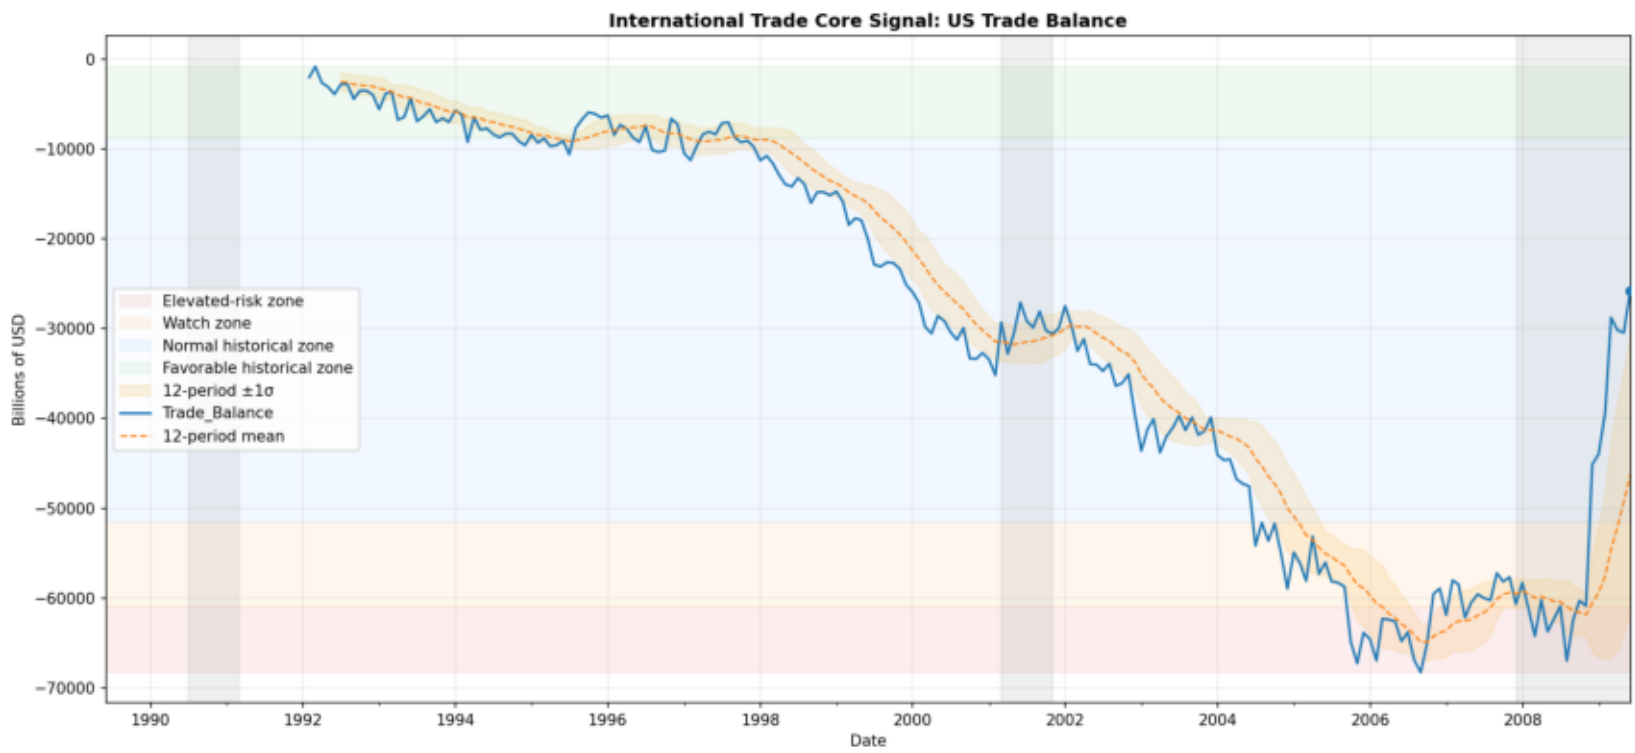

housing_starts_tracker.py [PEAK]

Housing Starts tracks year-over-year growth in residential housing starts. Housing is a cyclical, rate-sensitive sector, so persistent weakness often signals broader demand deceleration, while strong growth indicates improving construction momentum.

Tracker Comparison (1989-06-01 to 2009-06-01)

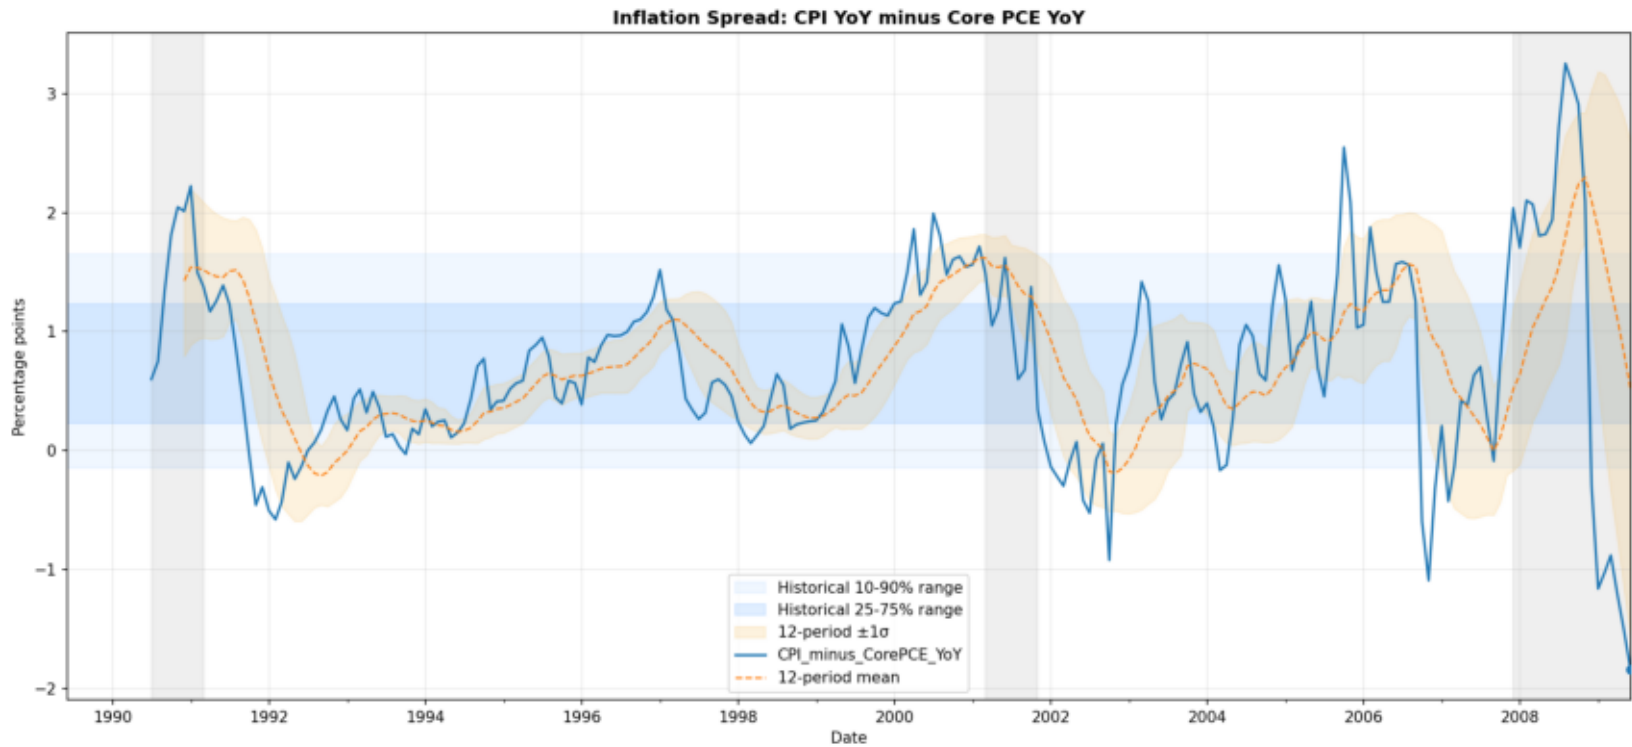

international_trade_tracker.py [PEAK]

International Trade core signal uses the U.S. trade balance level. A less negative or improving balance can indicate stronger external demand/competitiveness dynamics, while a widening deficit can reflect relative domestic demand strength or external softness depending on context.

Tracker Comparison (1989-06-01 to 2009-06-01)

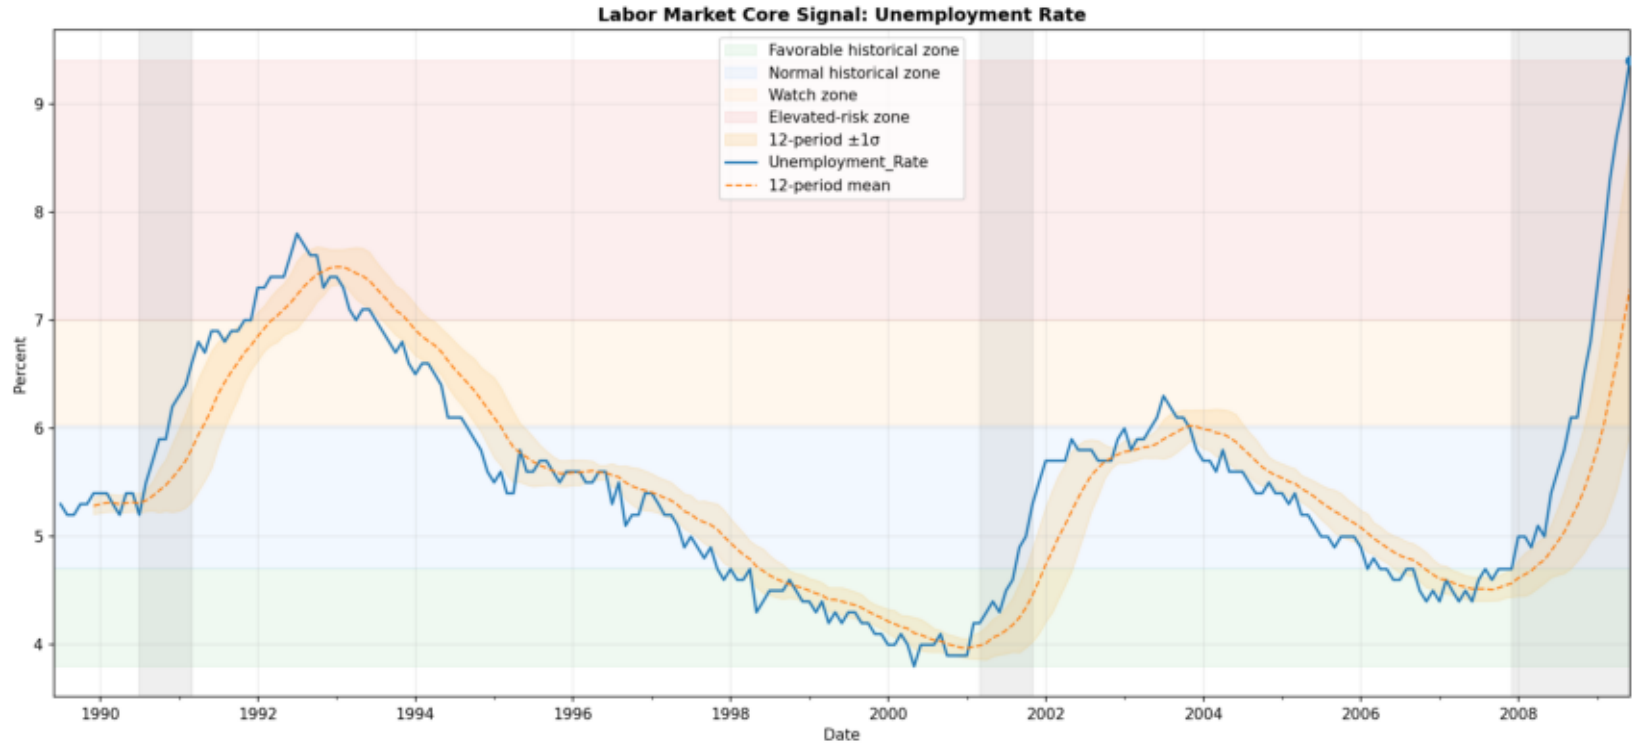

inflation_spread_tracker.py [BOTTOM]

Inflation Spread tracks the gap between headline CPI and Core PCE inflation (both year-over-year). A wider positive spread often signals stronger energy and goods price pass-through, while narrowing spreads can indicate disinflation in the most volatile components and a more stable inflation backdrop.

Tracker Comparison (1989-06-01 to 2009-06-01)

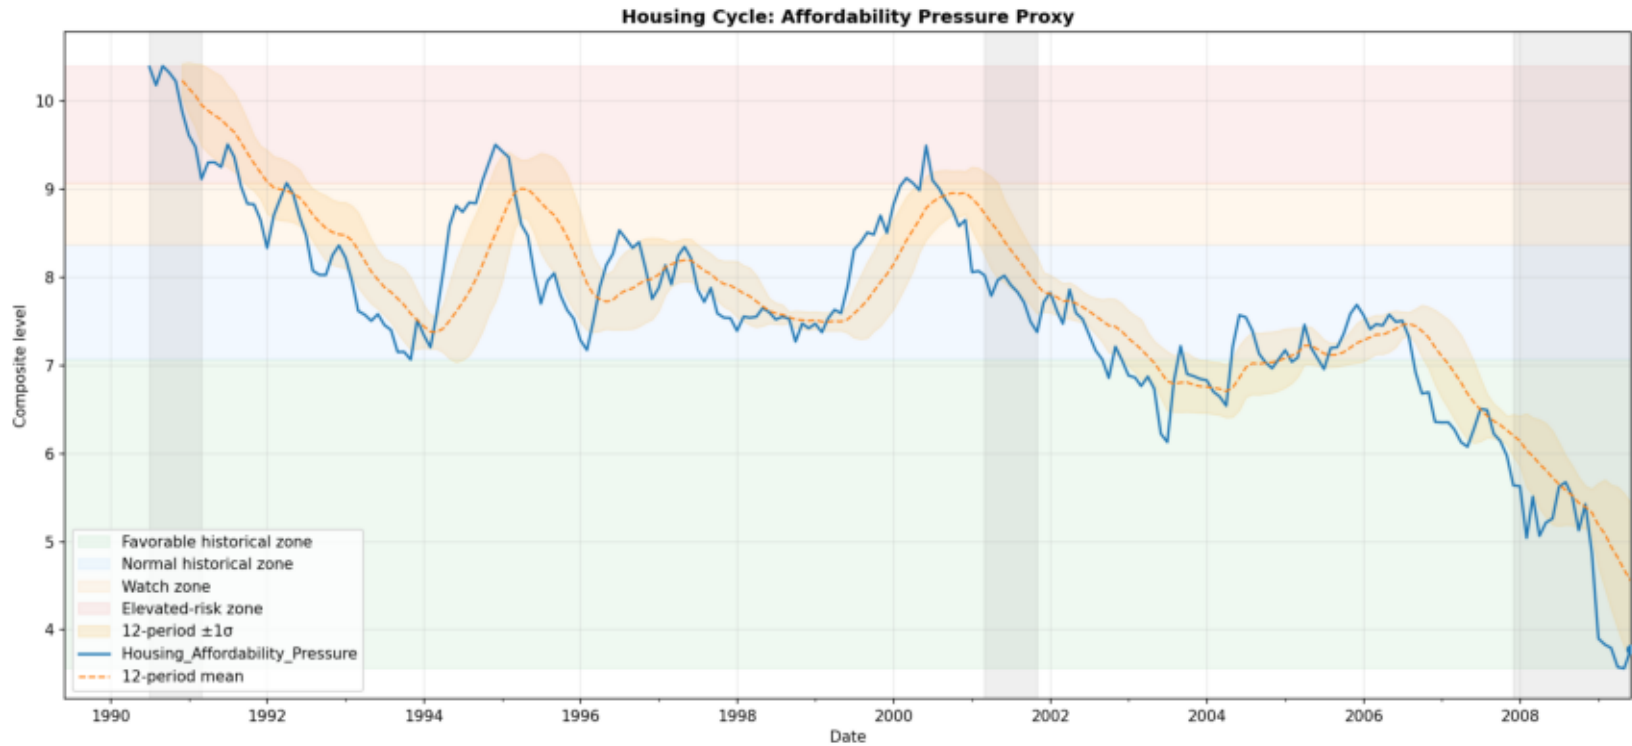

labor_market_tracker.py [BOTTOM]

Labor Market core signal tracks the U.S. unemployment rate. Lower unemployment generally reflects stronger labor demand and economic momentum, while sustained increases often indicate cooling activity and can be a lagging confirmation of downturn conditions.

Tracker Comparison (1989-06-01 to 2009-06-01)

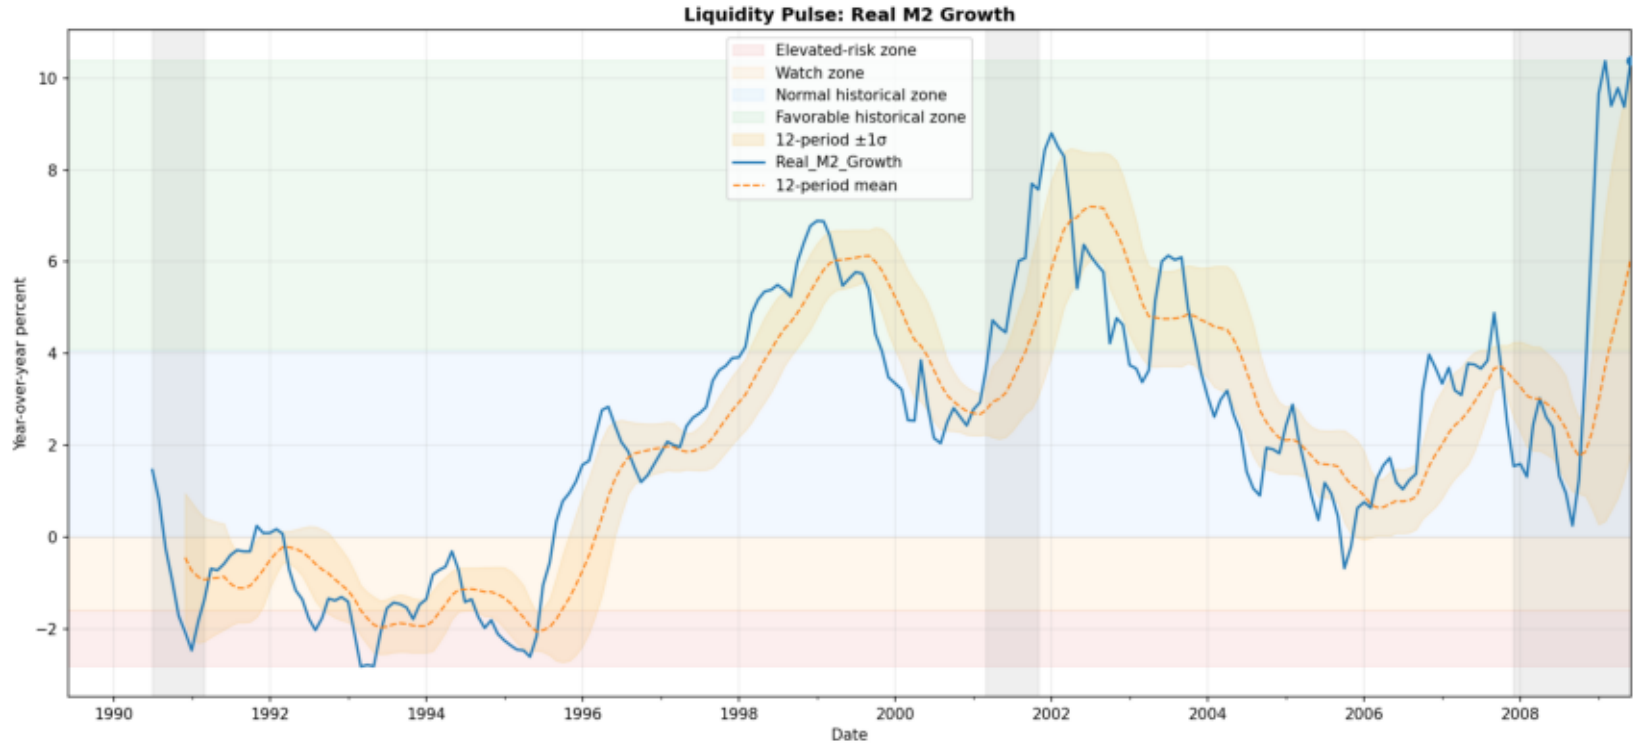

housing_affordability_tracker.py [BOTTOM]

Housing Affordability Pressure combines 30-year mortgage rates with home price inflation pressure. Higher values indicate tighter affordability conditions for marginal buyers, which often precede weaker housing turnover and broader interest-rate sensitive slowdown.

Tracker Comparison (1989-06-01 to 2009-06-01)

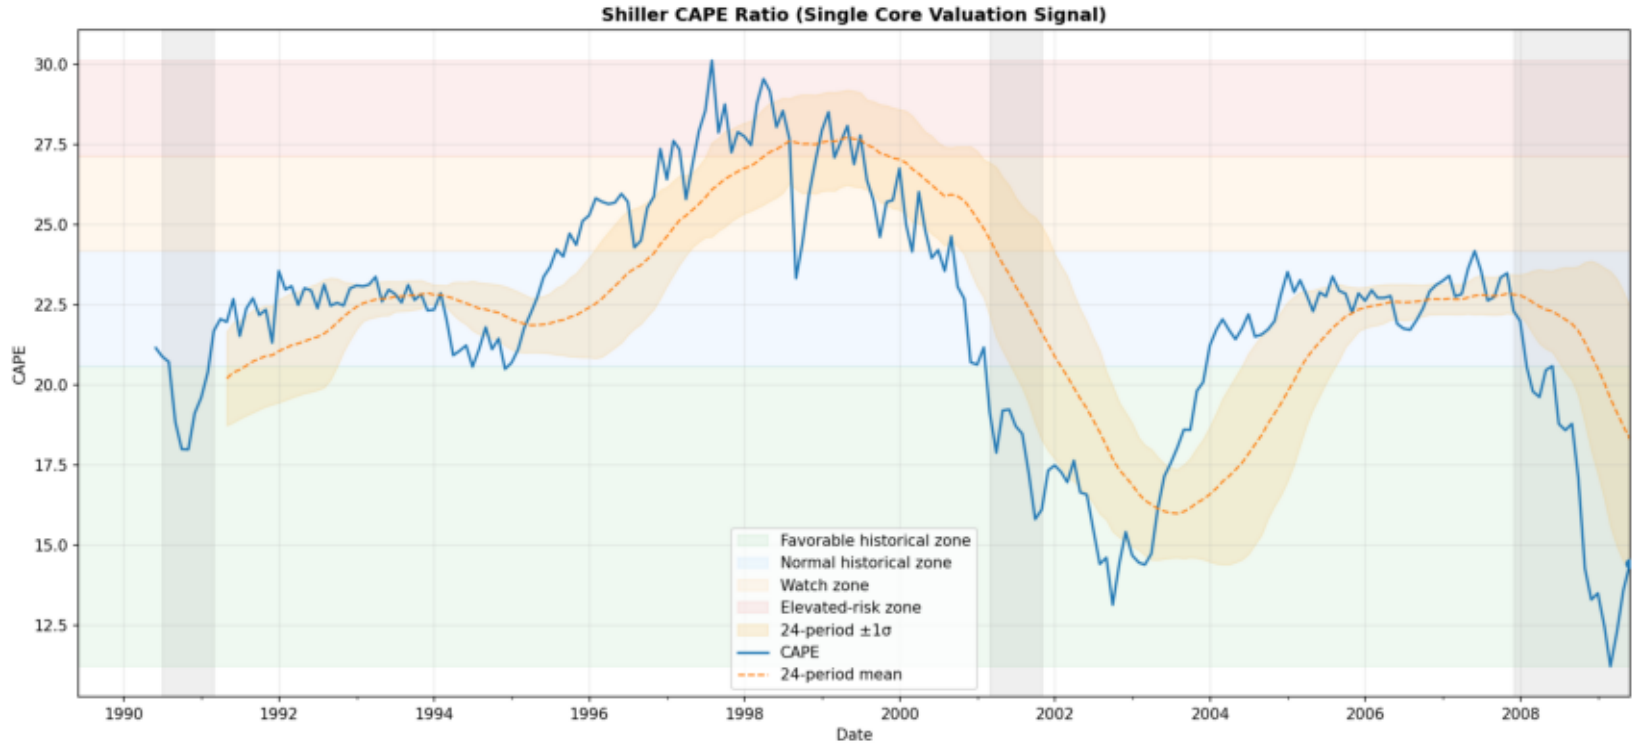

real_m2_growth_tracker.py [BOTTOM]

Real M2 Growth tracks broad money supply growth adjusted for CPI inflation (M2 YoY minus CPI YoY). Higher readings usually imply stronger liquidity support for nominal activity, while weak or negative readings indicate tighter real liquidity conditions.

Tracker Comparison (1989-06-01 to 2009-06-01)

shiller_cape_tracker.py [BOTTOM]

Shiller CAPE (cyclically adjusted P/E) compares market prices to long-run normalized earnings. Higher CAPE levels indicate richer valuation conditions and historically lower long-horizon forward return potential, while lower CAPE levels indicate more attractive long-run valuation regimes.
